

Application of Deep Learning to Text and Image Data

Module 2, Lab 1: Processing Text

In this notebook, you will learn techniques to analyze and process text data. Text processing is known as *natural language processing (NLP)* and is an important topic because of how much information is communicated through text. Knowing how to handle text will help you build models that perform better and are more useful.

You will learn the following:

- · What a word cloud is and how to create one
- · How to use stemming and lemmatization
- · What part-of-speech tagging is and how it impacts text processing
- · How to use named entity recognition to sort data

You will be presented with two kinds of exercises throughout the notebook: activities and challenges.

No coding is needed for an activity. You try to understand a concept, answer questions, or run a code cell.

Challenges are where you can practice your coding skills.

Index

- Word cloud
- Part-of-speech tagging
- Stemming and lemmatization

Initial Setup

First let's put everything in place.

```
In [1]: !pip install -U -q -r requirements.txt
```

Install the spaCy (https://spacy.io/usage) library. This will be used to perform some NLP tasks in the lab.

In [2]: !python -m spacy download en_core_web_sm

```
/home/ec2-user/anaconda3/envs/pytorch_p310/lib/python3.10/site-packages/to
rch/cuda/__init__.py:551: UserWarning: Can't initialize NVML

Installing collected packages: en-core-web-sm
Successfully installed en-core-web-sm-3.7.1
✓ Download and installation successful
You can now load the package via spacy.load('en_core_web_sm')
```

Requirement already satisfied: setuptools in /home/ec2-user/anaconda3/env

```
In [22]: # Import the dependencies
    from wordcloud import WordCloud, STOPWORDS
    import matplotlib.pyplot as plt
    import re, string
    import Stemmer
    import spacy
    from spacy import displacy
    import pandas as pd
```

Next, you need to create a function to preprocess text so that only real words, not special characters and numbers, are displayed.

```
In [23]: # Preprocess text
def preProcessText(text):
     # Lowercase and strip Leading and trailing white space
     text = text.lower().strip()

# Remove HTML tags
     text = re.compile("<.*?>").sub("", text)

# Remove punctuation
     text = re.compile("[%s]" % re.escape(string.punctuation)).sub(" ", text)

# Remove extra white space
     text = re.sub("\s+", " ", text)

# Remove numbers
     text = re.sub(r"[0-9]", "", text)

return text
```

Word cloud

Word clouds, which are also known as text clouds or tag clouds, help you visualize text data by highlighting the important words or phrases. Word clouds convey crucial information at a glance by making commonly occurring words bigger and bolder. These clouds are commonly used to compare and contrast two pieces of text. Word clouds are also used to identify the topic of a document.

To create a word cloud, you will use <u>WordCloud for Python</u> (<u>https://amueller.github.io/word_cloud</u>).

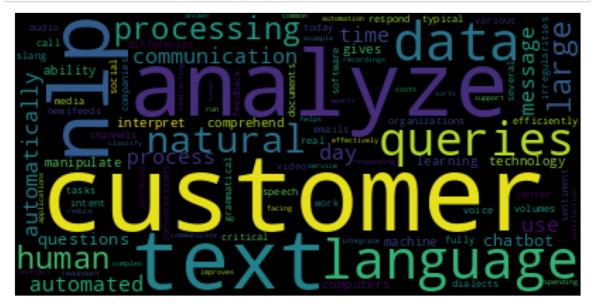

The following text is from the <u>What Is Natural Language Processing (NLP)?</u> (https://aws.amazon.com/what-is/nlp) page on aws.amazon.com.

In [24]: text = "Natural language processing (NLP) is a machine learning technology ability to interpret, manipulate, and comprehend human language. Organization of voice and text data from various communication channels like emails, text newsfeeds, video, audio, and more. They use NLP software to automatically pr the intent or sentiment in the message, and respond in real time to human co Natural language processing (NLP) is critical to fully and efficiently analy It can work through the differences in dialects, slang, and grammatical irre day-to-day conversations. \ Companies use it for several automated tasks, such as to: \ Process, analyze, and archive large documents Analyze customer feedback or call center recordings Run chatbots for automated customer service Answer who-what-when-where questions \ Classify and extract text You can also integrate NLP in customer-facing applications to communicate me customers. For example, a chatbot analyzes and sorts customer queries, response common questions and redirecting complex queries to customer support. This a costs, saves agents from spending time on redundant queries, and improves cu

```
In [6]: # Remove stop words before generating the word cloud
wordcloud = WordCloud(stopwords=STOPWORDS, background_color="black", max_wor

# Clean up the text to prevent plotting punctuation and duplicate words (for
wordcloud.generate(preProcessText(text))

plt.figure(figsize=(15, 10))
plt.axis("off")
plt.imshow(wordcloud);
```

Now that you have created a word cloud, do you see how it can help you quickly identify key words?

Note that the stop words were removed before the graphic was created. This is important so that words that don't impact the meaning of the text aren't overemphasized. Can you think of some examples of stop words?

In this example, you used the precompiled list of stop words that were curated by the WordCloud for Python project. You can print a list of the stop words to make sure that they cover the stop words that you expect.

```
In [7]: # Show the list of stop words
", ".join(list(STOPWORDS))
```

Out[7]: "they, this, www, she's, yours, wasn't, off, ours, r, would, we, themselve s, a, hence, these, you're, yourself, all, if, did, on, before, here, thei r, hasn't, some, doesn't, in, until, be, why, about, where's, no, that's, the, having, down, let's, being, can, those, whom, her, theirs, its, once, are, between, through, which, with, he's, both, own, what's, you'd, could n't, while, is, was, get, we'd, ourselves, than, above, where, yourselves, further, they've, shan't, hadn't, should, his, during, just, you, that, we re, who, ever, have, i'm, you'll, cannot, however, she'll, below, how's, o r, am, as, most, my, when's, she'd, of, when, there's, then, can't, other, do, same, shall, had, he, isn't, over, we've, at, an, com, i'll, only, ver y, so, you've, we'll, not, hers, him, they'll, does, http, like, more, mys elf, why's, and, aren't, too, been, few, don't, to, they'd, into, ought, h ow, there, under, them, your, himself, but, each, else, for, also, from, h as, it, didn't, otherwise, me, up, because, weren't, wouldn't, i'd, since, out, k, doing, haven't, our, who's, nor, shouldn't, such, we're, he'd, mus tn't, won't, could, it's, she, any, again, therefore, after, what, i, the y're, herself, itself, by, against, i've, here's, he'll"

Part-of-speech tagging

The process of classifying words into their corresponding part of speech based on definition and context is called *part-of-speech tagging*, which is also known as *POS tagging*. A part-of-speech tagger processes a sequence of words and attaches a part-of-speech tag to each word.

For this lab, you will use the Natural Language Toolkit spaCy (https://spacy.io/usage). The nlowing (https://spacy.io/usage). The nlowing (nlowing (nlowin

The following table provides the meanings for the tags from a lst of Universal POS tags:

Meaning	Tag
Adjective	ADJ
Adposition	ADV
Adverb	ADP
Auxiliary	AUX
Coordinating Conjuction	CCONJ
Determiner	DET
Interjection	INTJ
Noun	NOUN
Numeral	NUM
Particle	PART
Pronoun	PRON
Proper Noun	PROPN
Punctuation	PUNCT

Meaning	Tag
Subordinating Conjuction	SCONJ
Symbol	SYM
Verb	VERB

Now you can use the tagger to tag each token or word in the following text.

Important: Always remember to preprocess the text before tagging, as we have done before in this notebook.

In [8]: # Text sample
text

Out[8]: 'Natural language processing (NLP) is a machine learning technology that g ives computers the ability to interpret, manipulate, and comprehend human language. Organizations today have large volumes of voice and text data fr om various communication channels like emails, text messages, social media newsfeeds, video, audio, and more. They use NLP software to automatically process this data, analyze the intent or sentiment in the message, and res pond in real time to human communication. Natural language processing (NL P) is critical to fully and efficiently analyze text and speech data. It c an work through the differences in dialects, slang, and grammatical irregu larities typical in day-to-day conversations. Companies use it for several automated tasks, such as to: Process, analyze, and archive large docum ents Analyze customer feedback or call center recordings >Run chatbots for automated customer service grate NLP in customer-facing applications to communicate more effectively with customers. For example, a chatbot analyzes and sorts customer querie s, responding automatically to common questions and redirecting complex qu eries to customer support. This automation helps reduce costs, saves agent s from spending time on redundant queries, and improves customer satisfact ion.'

Try it yourself!

To use the spaCy part-of-speech tagger, run the following cell.

Observe the tags that are assigned to each word, and use the table from a previous cell to understand the meaning of each tag.

Out[9]:

	token_text	token_lemma
0	Natural	ADJ
1	language	NOUN
2	processing	NOUN
3	(PUNCT
4	NLP	PROPN
248	and	CCONJ
249	improves	VERB
250	customer	NOUN
251	satisfaction	NOUN
252		PUNCT

253 rows × 2 columns

Refer to the table in a previous cell to identify the tags that the spaCy tagger produces.

```
In [25]: # uncomment the code bellow to display the dependency parse or named entitie #displacy.render(doc, style="dep")
```

Stemming and lemmatization

Stemming and lemmatization are two ways to process words so that a model will be more efficient. Both methods remove parts of words so that they can be grouped together.

For example, in the following sentence, "ning" would be removed from "running" so that "running" and "run" would be categorized the same.

The child enjoys **running**, so they **run** every day.

What could make stemming and lemmatization difficult to do properly?

Try it yourself!

Stemming

Stemming is a rule-based system to convert words into their root forms by removing suffixes. This method helps to enhance similarities (if any) between sentences.

Examples:

"jumping", "jumped" -> "jump"

```
"cars" -> "car"

In [11]: # Lot's List the Language quaitable
```

```
In [11]: # let's list the language available
    print(Stemmer.algorithms())
```

['arabic', 'armenian', 'basque', 'catalan', 'danish', 'dutch', 'english', 'finnish', 'french', 'german', 'greek', 'hindi', 'hungarian', 'indonesia n', 'irish', 'italian', 'lithuanian', 'nepali', 'norwegian', 'porter', 'portuguese', 'romanian', 'russian', 'serbian', 'spanish', 'swedish', 'tami l', 'turkish', 'yiddish']

```
In [12]: # we will use english for this example
stemmer = Stemmer.Stemmer('english')
```

```
In [13]: original_text = " This is a message to be cleaned. It may involve some thi
    print(original_text)
```

28
          and
                           and
29
          tabs
30
31
32
```

Out[15]:

```
In [26]: stemmed_text = " ".join(stemmed_sentence)
print(stemmed_text)
```

```
This is a messag to be clean . It may involv some thing like : < br > , ? , : , '' adjac space and tab .
```

From the output of the previous code cell, you can see that stemming isn't perfect. It makes mistakes, such as "messag", "involv", and "adjac". Stemming is a rule-based method that sometimes mistakenly removes suffixes from words. It does run quickly, which makes it appealing to use for massive datasets.

Lemmatization

If you aren't satisfied with the result of stemming, you can use the lemmatization instead. This method usually requires more work but gives better results.

Lemmatization needs to know the correct word position tags, such as "noun", "verb", or "adjective". You need to use another spaCy function to feed this information to the lemmatizer.

The cell below uses part of the full list of position tags listed in the previous session Part-of-speech tagging.

	columns=['t		
Out[17]:		token_text	token_lemma
	0		
	1	This	this
	2	is	be
	3	а	а
	4	message	message
	5	to	to
	6	be	be
	7	cleaned	clean
	8		
	9	It	it
	10	may	may
	11	involve	involve
	12	some	some
	13	things	thing
	14	like	like
	15	:	:
	16	<	<
	17	br	br
	18	>	>
	19	,	,
	20	?	?
	21	,	,
	22	:	:
	23	,	,
	24	"	"
	25		
	26	adjacent	adjacent
	27	spaces	space
	28	and	and
	29	tabs	tab
	30		
	31	•	
	32		

```
In [27]: lemmatized_text = " ".join(token_lemma)
print(lemmatized_text)
```

```
this be a message to be clean . it may involve some thing like : < br > , ? , : , '' adjacent space and tab .
```

How do the results compare? Is the lemmatized text better than the stemmed text?

Named entity recognition

Named entity recognition involves identification of key information in text and then classifying that information into predefined categories, such as person, organization, place, or date. This is one of the most popular NLP tasks.

For this section, you will use <u>spaCy (https://spacy.io)</u>. The following table lists the categories and meanings of the category labels that the spaCy module uses.

Category	Meaning
CARDINAL	Numerals that don't fall under another type
DATE	Absolute or relative dates or periods
EVENT	Named hurricanes, battles, wars, sports events, and so on
FAC	Buildings, airports, highways, bridges, and so on
GPE	Countries, cities, states
LANGUAGE	Any named language
LAW	Named documents made into laws
LOC	Non-GPE locations, mountain ranges, bodies of water
MONEY	Monetary values, including unit
NORP	Nationalities, or religious or political groups
ORDINAL	"first", "second", and so on
ORG	Companies, agencies, institutions, and so on
PERCENT	Percentage, including "%"
PERSON	People, including fictional
PRODUCT	Objects, vehicles, foods, and so on (not services)
QUANTITY	Measurements, as of weight or distance
WORK_OF_ART	Titles of books, songs, and so on

The following text was retrieved from the <u>Amazon - The Climate Pledge</u> (https://www.aboutamazon.com/planet/climate-pledge) page of the About Amazon website.

```
In [28]: # Sample text for named entity recognition
    ner_text = "Amazon and Global Optimism co-founded The Climate Pledge, \
    a commitment to net-zero \
    carbon by 2040."
```

```
In [29]: # Load the spaCy English pipeline for named entity recognition
NER = spacy.load("en_core_web_sm")

# Tag entities in the text
for word in NER(ner_text).ents:
    print(word.text, word.label_)
```

Amazon ORG Global Optimism ORG The Climate Pledge WORK_OF_ART 2040 DATE

Visualizing the Tags

spaCy has a visualizer called displaCy that you can use to visualize tags. Run the following cell to see it working.

```
In [30]: # Visual tag with text
displacy.render(NER(ner_text), style="ent", jupyter=True)
```

Amazon **org** and Global Optimism **org** co-founded The Climate Pledge **WORK_OF_ART**, a commitment to net-zero carbon by 2040 **DATE**.

As you can see, named entity recognition can help you identify different entities in text. The process isn't always correct, but it can process large sections of text faster than a human can.

Conclusion

In this lab, you practiced using text processing techniques.

Next lab

In the next lab, you will learn about the bag-of-words (BoW) method to convert text data into numerical values.
